Buyers Checklist for calves and store cattle

Buying in livestock is risky and is the most likely way of introducing a new disease onto your farm. The cost of a disease outbreak can be huge. There are many potential diseases of concern as this checklist shows. The fewer red marks on the list, the lower the risk of buying in disease. To minimise the risk of buying in disease, source stock from as few farms as possible and ask questions about health status as shown on this checklist. Discuss your stock sourcing policy with your vet. All stock bought on to the farm should be quarantined for 3 weeks on arrival to allow time for vaccinations and treatments to be completed and for health to be assessed.

General questions

Is the source herd closed?	Yes		No
----------------------------	-----	--	----

Does the source herd belong to any health accreditation scheme?	Yes	No	
---	-----	----	--

Bovine Viral Diarrhoea is a viral disease, causing clinical signs including infertility and abortion. Calves born to infected dams are termed Persistently Infected (PI) and will eventually die, but can spread BVD to other cattle.

Has the source herd been tested to prove it is free of BVD? (CHeCS accredited)	Yes	No	
--	-----	----	--

Is the source herd vaccinated against BVD?		Yes	No
--	--	-----	----

Have the cattle to be purchased had a clear test for BVD antigen?	Yes	No	
---	-----	----	--

Are the animals to be purchased pregnant?	No	Yes	
---	----	-----	--

Infectious Bovine Rhinotracheitis (IBR) is a viral disease of cattle causing respiratory disease, reproductive failure and milk drop. A carrier status can be produced.

Has the source herd been tested to prove it is free of IBR? (CHeCS accredited)	Yes	No	
--	-----	----	--

Is the source herd vaccinated against IBR?		Yes	No
--	--	-----	----

If the source herd does vaccinate, have they always used a marker vaccine?		Yes	No
--	--	-----	----

Parasites may be harboured by purchased cattle, and may pose a risk to your herd.

Have the animals to be purchased been vaccinated against lungworm?	Yes		No
--	-----	--	----

Has any treatment been given to eliminate parasites in the last three weeks?	Yes		No
--	-----	--	----

Is there any evidence of external parasites, such as ringworm, lice?		No	Yes
--	--	----	-----

Have the animals to be purchased had a clear test for liver fluke in the last year?	Yes	Not tested	No
---	-----	------------	----

Bovine Tuberculosis is a notifiable bacterial disease, which can also affect people.

Is the source herd tested for TB more frequently than every 4 years?		No	Yes
--	--	----	-----

Has the source herd had TB reactors or Inconclusive results in the last 4 years?		No	Yes
--	--	----	-----

Have the animals to be purchased had a clear test in the last 60 days?	Yes	Not tested	No
--	-----	------------	----

Salmonella is a disease causing scour and abortions. This disease is transmissible to humans (zoonosis).

Have there ever been a confirmed cases in the source herd?	No		Yes
--	----	--	-----

Is the source herd vaccinated?		Yes	No
--------------------------------	--	-----	----

This is simple guide, remember to discuss with your vet to test and treat where a risk has been identified.

Eblex would like to acknowledge the Aberdeen Angus Cattle Society for their contribution to this checklist
